#### Cotton and Corn.

The Agricultural Department of Georgia, has been questioning the planters of that State and obtaining their answers with reference to the best fertilizers for cotton and corn. In a recent report of the Department, a dish of valuable information gathered in this way, is set before the public, the cream of which may be skimmed off about as follows:

The mass of Georgia farmers, according to this report, favor the employment of composts in which stable manure and cotton seed figure, both with or without commercial fertilizers. There is also a very guanos and other fertilizers. Mr. W. A. Speer of Henry county, who cultivates soil red and thirsty, with good clay subsoil, gives his preference to compost on account of its being more durable and not impoverishing the land, as do, in his opinion, most commercial guanos when applied formula: 750 pounds leaf mould, 500 pounds cotton seed, 400 pounds stable pounds per acre on cotton.

Mr. J. M. Dill, Lincoln county, believes that commercial fertilizers applied economically will pay, but that a compost of under the stable floor, that is quite anstable manure and cotton seed with a good other. acid phosphate is the best and cheapest clay sub-soil. M. J. T. Dennis, Putnam county, says that guano has paid him every year, but not so much during 1880 as usual, on account of the excessive drought tollowed by too much rain. He uses compost mostly on his cotton, and thinks it pays better than guano.

Mr. E. B. Heard, Elbert county, after using commercial fertilizers for a number of years, says that under no circumstances would he attempt to raise a cotton crop without them; solid, dark, porous upland, with stiff clay sub-soil. Mr. W. H. Ellison, Talbot county, whose experience has been with dark mulatto soil, having a clay subsoil, says that no fertilizer, either commercial or domestic, pays so well on corn or small grain as compost. All high grade guanos pay on his land when well broken and the seasons are favorable, but

Mr. Johnson, Bibb county, who works sandy loam land well supplied with humu and having a compact red clay sub-soil, thinks that commercial fertilizers do not pay more than a small per cent on the capital, in a series of years. Not so with roll county, who has been using commercial fertilizers for many years-soil stiff-is satisfied that they pay if judiciously used. His plan is to apply about two hundred pounds per acre, very deep, running off the rows with a scooter plough following in the same furrow with a long, straight steel shovel. He puts the guano in that furrow and runs two first-listing furrows with three-inch scooter, following with two furrows of turn plough to finish the beds. When planters can get enough of it, Mr. Russell thinks the best fertilizer for either cotton or corn is good compost of stable manure and cotton seed, mixed in equal quantities and penned up dry for six weeks.

Mr. J. T. Lindley, Cobb county, considers a compost made from stable manure, cotton seed, and some good dissolved bone an admirable tertilizer. Mr. R. W. Everett, Polk county, about the middle of February each year composts stable manure and cotton seed, using equal quantities of each in alternate layers. He applies this compost without any commercial ingredient to his cotton just as he would guano, only using more to the acre. He makes this go as far as it will, and then finishes out with commercial manure. His compost induces better yields than does any guano he has ever used.

Commissioner J. T. Henderson, in the circular recently issued, advises Georgia farmers who are testing commercial fertilizers not to buy any fertilizers or chemical for compounding, unless it has both the manufacturer's guaranteed analysis and the inspector's tag attached. Farmers are also informed, after a crop is made, if there is reason to believe that the fertilizers employed were not as represented to be, that samples forwarded to the Department at Atlanta will be analyzed without charge.

## How to Destroy Insects.

Slugs are occasionally seen eating large holes or notches in the leaves of all succulents and begonias. They usually feed during the night. Cut potatoes, turnips or some other fleshy vegetable in halves, and place conveniently near the plants. The slugs will gather upon the vegetable and are easily destroyed.

The white worm which infests occasionally all soils where plants are kept in pots may be removed as follows: Sprinkle lime water over the soil, or sprinkle a little slaked lime on the earth and in the saucer of the pot. Lime water may be easily made by slaking a large piece of lime in a pail of cold water, letting this settle and then bottling the clear water for use. Give each pot a tablespoonful

To destroy the little bugs on the oleander take a piece of lime the size of a hen's egg and dissolve it in about two quarts of water. Wash the stock and branches of the tree with this water.

To destroy plant lice take three and a half ounces of quassia chips, and five drachms Stavesacre seed in powder; place in seven pints of water and boil down to five pints. When cold the strained liquid is ready for use, either by means of a watering-pot or syringe.

No insect which usually infests the house, and crawls over the floors or woodwork, can live under the application of hot alum water. It will destroy red and black ants, cockroaches, spiders and chintz bugs. Take two pounds of alum and dissolve it in three or four quarts of boiling water; let it stand on the fire until the alum is all melted, then apply it with a brush) while nearly boiling hot) to every joint, and crevice in near alcosts, bad joint and crevice in your closets, bed-stead, pantry shelves, etc. If in white-washing a ceiling plenty of alum is added to the whitewash it will keep off insects.

A safe rule for plants of any kind is to allow half a gallon of water to every ounce of tobacco. Procure the strongest shag, and make an infusion by pouring upon it boiling water.

Do Fertilizers Last? Upon this subject a valuable exchange

The question is often asked by those who have had but little experience in the use of commercial fertilizers for growing farm crops, "do they last like barn ma-nure?" Now, before answering this question, we should be inclined, Yankeelike, to ask another, which is, how long do barn manures last? Barn manure is talked of as a standard for measuring the value of commercial fertilizers, but to us it seems a very imperfect and uncertain standard. The manure from horses, cattle, hogs, sheep and poultry, is all classed as barn manure, while they vary greatly general expression in favor of commercial in value, not only on account of the difference in the character of the animals, but also because the manure from each class of animals varies very much in value according as they are fed well or poorly, are idle or working, or are young or old. Then barn manure, as we find it, varies in value according to the manner in which it alone. He composts after the following is saved and kept. It the liquid is all re-formula: 750 pounds leaf mould, 500 tained, if the whole is kept under cover till used, and not allowed to heat and waste manure, 300 pounds commercial guano, 50 by excessive decomposition, that is one pounds salt, applied at the rate of 650 thing. If it is exposed to the weather so that the soluble portions are washed away beyond recovery, if the liquid portions are allowed to soak down into the subsoil

The fact is, stable manure is so far from fertilizer that can be used. Mr. E. S. being uniform in quality and character Wellons, Houston county, thinks that that it is very far from being a true standgood guano uniformly pays; he also ard for measuring values in commercial tavors acid phosphate composted with tertilizers. Old, well-rotted horse manure, stable manure and cotton seed. His soil made from grain-fed animals, is very is gray and rather sandy, with good red quick in its action when made fine and used as a topdressing upon mowing lands just after the crop is removed. Coarse cow manure made from bog hay, and then thrown out at a stable window to dry into hard lumps, would be a very slow and a very lasting substance applied upon mowng fields and left on the surface without pulverizing, but its lasting qualities would be much more apparent in the lumps of manure itself than in the increased growth of the crop. Raw, coarse bone is a lasting manure when spread on the top of a dry pasture, while finely ground, dissolved bone acts quickly, it properly ap-

Fertilizers, like manures, last long, or act quickly, according as they are in condition to be used by the plants, and according as the plants are in condition to use found at our them. We have spread commercial mabest on lands abounding in vegetable nures on grass land after having, and have had the rowen crop greatly im proved in consequence; but from several experiments and much observation we have come to the conclusion that it does not pay, as a rule, to topdress with quick acting manures, especially for a rowen crop. The grass plants in the latter half composts, from which he has never known of the season are not in condition to aploss to occur. Mr. M. R. Russell, Car- propriate fertilizers as they are in early summer. It is not their nature to make a heavy growth of stems in the fall, and without height it is impossible to get very

> heavy crops. Our practice now is to apply grass topdressing fertilizer only in the Spring, when a full return may be expected, and to apply only about what it is supposed the grass plants can appropriate during the early portion of the Summer. Of course we refer to the use of the popular soluble fertilizers, such as are prepared specially for grass, like the Stockbridge, Bradley and Darling grass fertilizers. These all contain nitrate of soda, sulphate of ammonia, dried blood, dissolved bone or other quick acting ingredients. Such preparations are not considered very lasting, but from the experience of the present summer we are inclined to believe that they will, ordinarily, if properly applied, tast till they are appropriated by the plants, and that, it seems to us, is all one can reasonably ask.

In the Spring just as the grass was getting quite green, we applied topdressing fertilizer at the rate of ten dollars worth per acre to nearly every acre that we intended to mow. After applying it there was almost no rain at all till hay time, and only on the moist portions did the fertilizers seem to pay for the application, On the dry knolls the grass dried up and was little if any better for the fertilizer, while on the good grass land the application paid well, even better than in ordinary years, because the price of hay is carried up several dollars per ton, on account of the drought. After having the rains came, and early in August there was a second crop ready to mow, and we have observed what is very unusual, that the heaviest grass is frequently on dry knolls. This shows not only that the application on the moist land was well used up by the first crop, but that the fertilizer spread on the dry knolls was not lost or wholly wasted, although the return could not be equal to what it would have been had there been rain enough to make the fertilizer available to the plants in the proper season for their growth.

Agricultural chemists teach us that nitrates when applied to farm lands, are liable, unless used up by plants, to change their forms, or in some way become practically unavailable as plant food. They also teach us that they are very diffusable and easily washed through the soil by heavy rains. If these statements are true, it follows that their application should be so timed, and their quantity so regulated, that the growing crop can appropriate them while they are within reach and in an available form. The conclusion then is, apply quick acting fertilizers only in such quantities as it is expected the present crop can appropriate, and not to apply them very long in advance of the growing

If commercial fertilizers can be so prepared and applied that there shall be no waste, but all their fertilizing elements appropriated by the crops, then we care not if it is found necessary to apply them little and often. The labor of spreading is, perhaps, somewhat greater where a ton is applied at two or three different times, but if purchased only about as fast

R R McAden, R M Oates as used, the saving of interest on invest-ment will fully offset this item.

At present we are inclined to expect and Silver Coin, and Government and other Sethat all the first-class popular fertilizers curities. will pay for themselves the first year, if properly used, and the season is favorable. If effects are visible in after years, it is looked upon as so much clear profit.

The oldest farmers have never seen grass as green and pastures as good in November in Kentucky.

A Barren county, Ky., beet measures two feet in length, twelve feet in circum-ference and weighs eight pounds.

Dried Fruit.

The exportation of dried fruit, especially apples and peaches, will exceed that of last year. This is the opinion of knowing ones. Dried fruit is one of the leading staples of Nothwestern North Carolina. There are no large orchards where special attention is devoted to the growth of fruit variety of for the sole purpose of exportation; but the few apple, and peach, and plum, and apricot trees, are the surroundings of every home; and the fruit, generally taken care of by the women and children, brings in many a stray dollar, and secures many a little comfort or laxury, which, were the families dependent entirely upon the salary of the husband could not be indulged in. The small orchard in this section is an institution to the masses, for great improvement on those sold in this market besides being a matter of pride and last season. pleasure, it is also a source of wealth.

Just as we told the people of Western Carolina who are selling off their possibly afford to make them. trees, as if there was a collapse in prices imminent instead of an advance. The Northern people need the choice woods of the South and they are getting them. We sell now; but if you will sell, then be sure to ask three times more than you ever asked before - Wilmington Star.

## A Perfect Corset at Last.

After spending over twelve thousand dollars n experiments, Dr. Warner has perfected a material for boning Corsets called

Coraline, Which is vastly superior to horn or whalebone ITS ADVANTAGES ARE:

First.—It cannot be broken. A reward of \$5 will be paid for every Corset in which the Coraline breaks with six months ordinary wear. Second-It is more pliable than whalebone and adapts itself more readily to the movements of the body.

Third—It is not affected by cold, heat or mois Fourth-It is the cheapest and most serviceable Corset ever made. The Coraline Corset is made throughout of superior materials, and is warrented in every re-

spect. If not found entirely satisfactory, the pur-chase money will be refunded. Ask for Dr. Warner's Abdominal Corset, with extension front. Unequaled for beauty, elegance and style. And Dr. Warner's Nursing Corset, the only perfect Nursing Corset in the market. Ask for Dr. Warner's Cross-Boned Hip Corset. We have the exclusive sale in this market of the above Corsets, and will be pleased to have the

trade inspect them. T. L. SEIGLE & CO. June 10, 1881.
